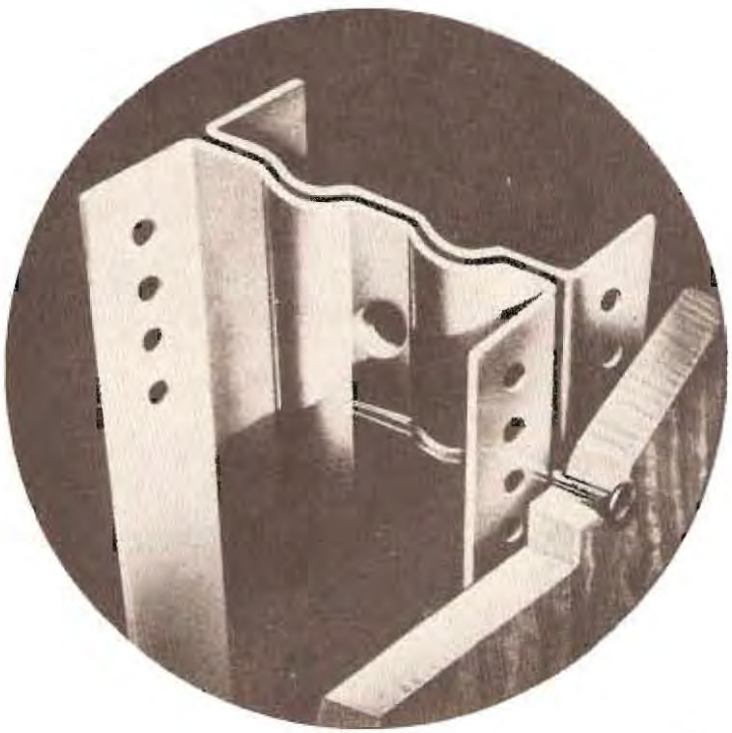
CONTENTS



THE STRAN-STEEL NAILING GROOVE

The distinctive feature of Stran-Steel is the nailing groove. This groove is in all Stran-Steel joists, arch ribs and studs, which are made by welding two pieces of steel together. The small space remaining between these pieces is just large enough to admit an ordinary nail. When a nail is driven into the groove, it is deformed and clinched in a grip of steel with a holding power much greater than that of wood. In this manner collateral materials are secured to the steel framework with the ordinary hammer-and-nails method. Construction in which Stran-Steel framing is used proceeds in the same way as with ordinary framing. Dimensions of Stran-Steel members conform exactly to the requirements of the collateral materials used with it.

SUGGESTIONS TO ERECTOR

ORGANIZATION. The erection of the Quonset 40 Building is simple and fast if the operations are done in sequence and properly. It is important to get off to the right start by being careful to set anchor bolts properly and starting ribs plumb. Likewise the bulkhead framing must be square and level so the windows and corrugated steel sheets will fit and so the doors will operate.

A logical division of personnel is into crews for (1) building the foundation and setting anchor bolts, (2) raising the ribs, (3) framing the bulkhead and (4) applying the covering.

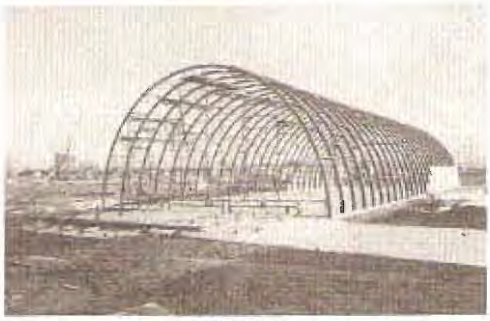
The instructions give each operation complete in its proper order. It is not always necessary, however, to finish an operation throughout the entire building before the next one is begun. Much time can be saved by having the crews working on their respective portions of the work simultaneously. For example, the rib crew can be assembling ribs, and the bulkhead crew can be assembling the bulkhead framing while the channels are being laid. Then, after the first four ribs from the end have been raised, plumbed, and braced, the bulkhead frame can be pulled up into position while the erection staging is still near the end of the building. The men applying the corrugated steel covering can begin their work after the first bulkhead frame is raised and their work should follow closely behind that of the crew raising the remainder of the ribs. Meanwhile, the bulkhead crew should assemble the other bulkhead framing and have it ready for erection when the last rib is in position.

HINTS. If any of the steel members have become damaged in shipment, the easiest way to straighten them is by placing the bent part over a crate or sawhorse and having a man bear down on each end. The hardest way to straighten is by using a hammer.

There is a trick to opening the banded crates. When this is known and used, much time and effort can be saved. Use a large screwdriver, as used for assembling the frame, insert flat side under steel band about an inch or inch-and-half. Turn the screwdriver about the handle roughly an eighth turn. This brings the sharp edge of the screwdriver in contact with the band. Pull up quickly. This motion cuts the band rather than breaking it. When the knack of using a screwdriver is learned, opening the crates is an easy job. Open crates carefully so lumber can be reused in building erection staging.

The importance of using the right nails, screws, and attachments cannot be too strongly stressed. Follow the instructions closely in this regard.

FOUNDATION

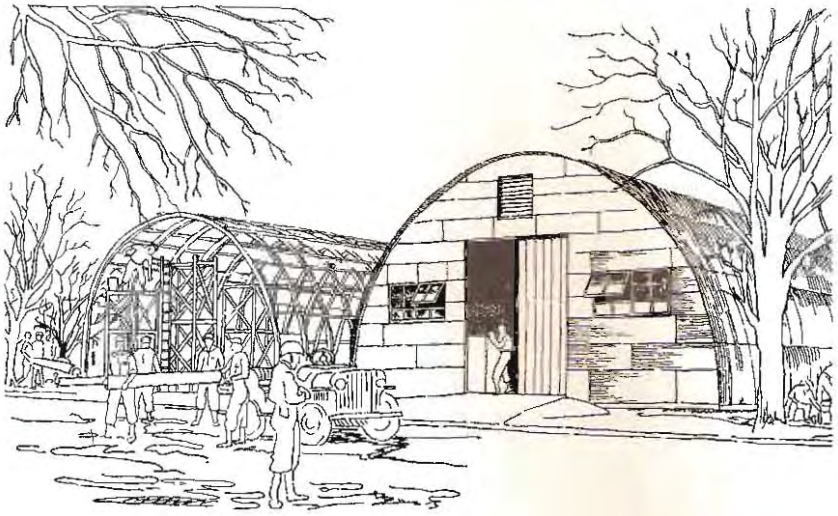


FRAME

SIDE COVERING

BULKHEAD FRAME

BULKHEAD COVERING



1. **Foundation.** Set anchor bolts, pour concrete. Lay bottom channels. (See pages 4 and 5.)

2. **Frame.** Assemble and raise ribs. Install purlins and channel bridging. (See pages 6 and 7.)

3. **Bulkhead Frames.** Assemble bulkhead frames of steel studs. (See pages 8 and 9.)

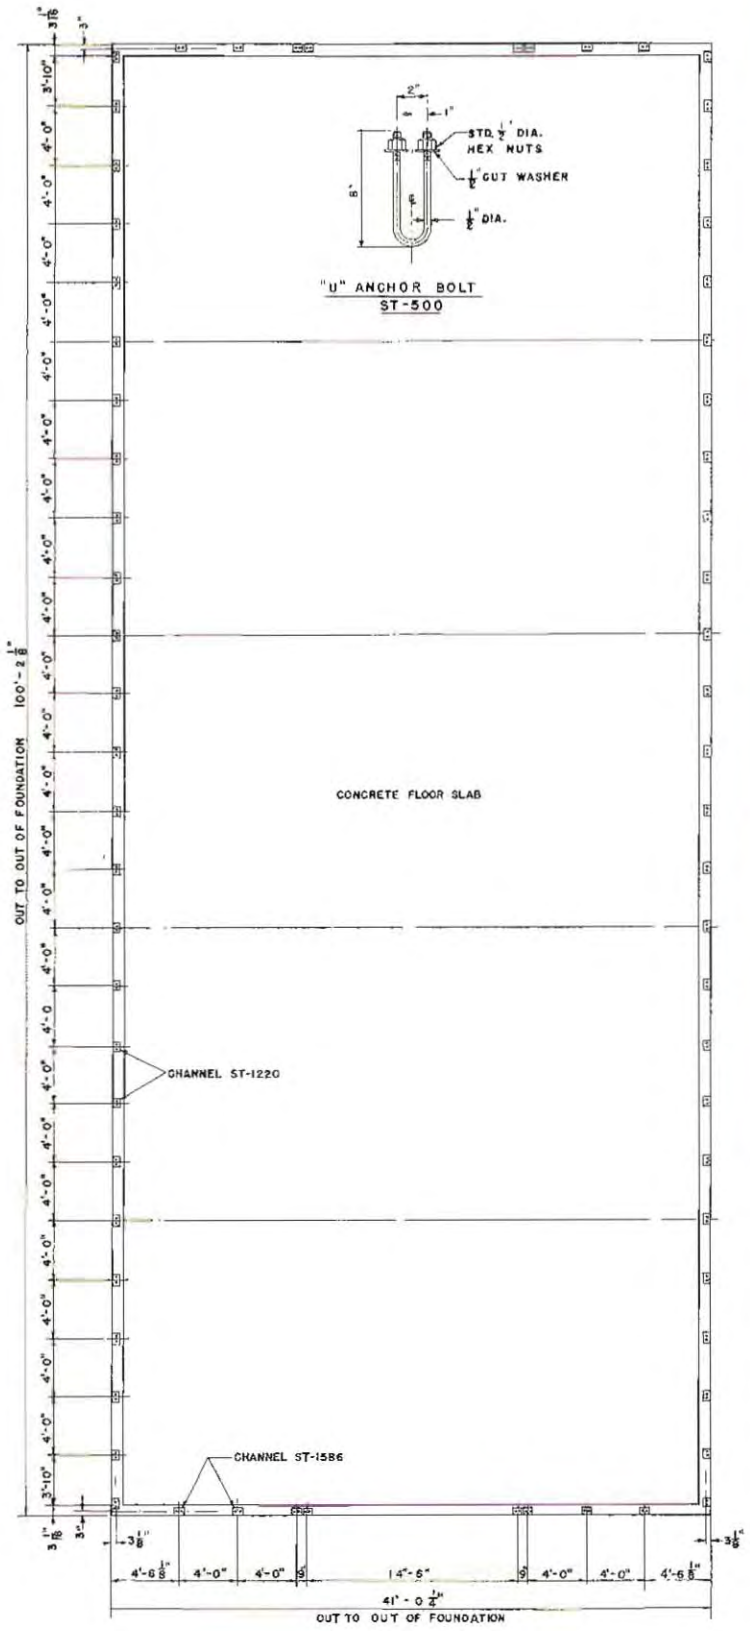
4. **Side and Roof Covering.** Nail flat corrugated sheets to ribs on sides of building. Install flashing. Nail curved corrugated sheets to purlins at crown of building. (See pages 10 and 11.)

5. **Bulkhead Covering.** Apply corrugated sheets. Install windows, doors and louvers. (See pages 12 and 13.)

6. **Clean Up.** Save all scraps, bands, blocks, nails, screws and crating material not used. Sort and store for future use.

COMPLETED BUILDING

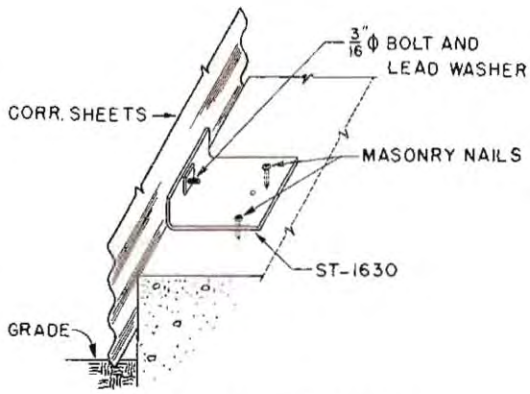
FOUNDATION



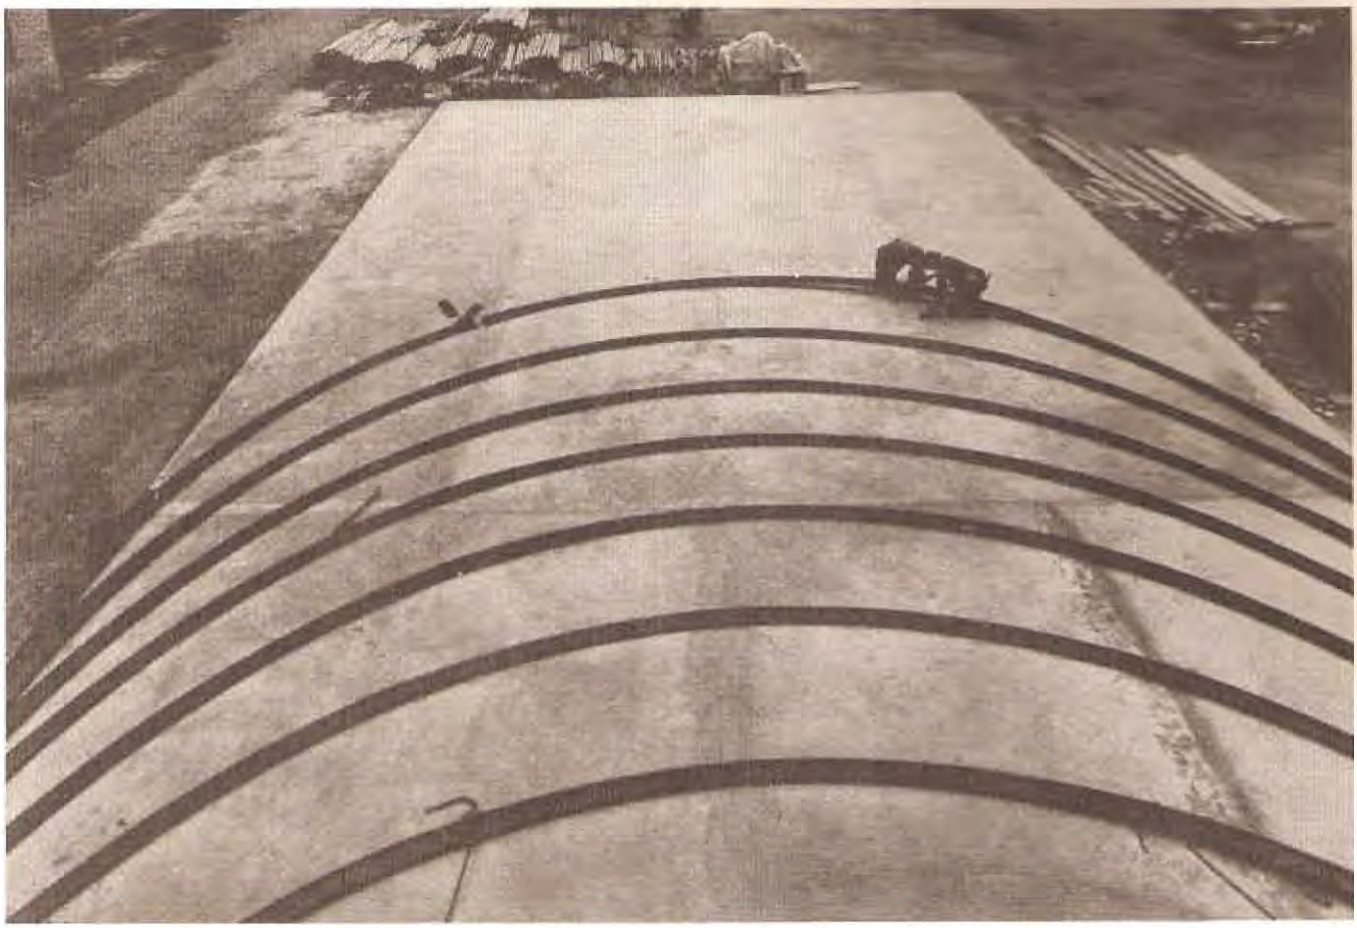
PLAN OF ANCHOR BOLTS AND BOTTOM CHANNELS

BOTTOM CHANNELS PLACED OVER ANCHOR BOLTS

BOTTOM CHANNELS BOLTED DOWN



DETAIL OF CLIP ANGLE AT FOUNDATION



ASSEMBLING RIBS ON FOUNDATION

STEP 1 Place the 6¼"x 6" bottom channels (ST-1220) over the anchor bolts set in the concrete and bolt them down. Do this as follows:

(a) Place concrete forms, pour the concrete. Place the ½" round by 8" long "U" anchor bolts (ST-500) accurately (see foundation plan) by measuring along forms and using points on the forms as off-sets to locate the center lines of anchor bolts. The 4'06" dimension across the building from centerline to centerline of anchor bolts must be maintained.

(b) After the concrete has hardened remove the wooden formwork.

(c) Lay the 6¼" x 6" bottom channels (ST-1220), which are punched to fit over the bolts, into position.

(d) Carefully level the channels with small wedges at the bolts. When channels are level, grout underneath them with cement mortar, slip washers over tops of anchor bolts and draw nuts down tight. Suggestion—floor slab can be poured conveniently in four longitudinal strips about 10 feet wide to make screeding easy.

(e) Fasten angles (ST-1630) to concrete with two masonry nails before concrete has hardened but not later than 2 days after concrete has been poured. One angle is placed in center between rib channels. Upstanding leg of angles should be flush with outer edge of concrete.

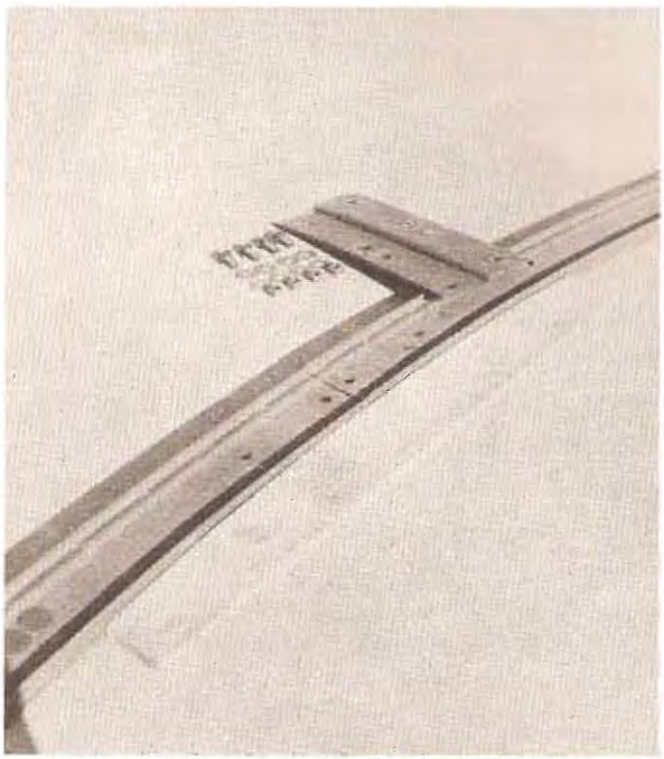
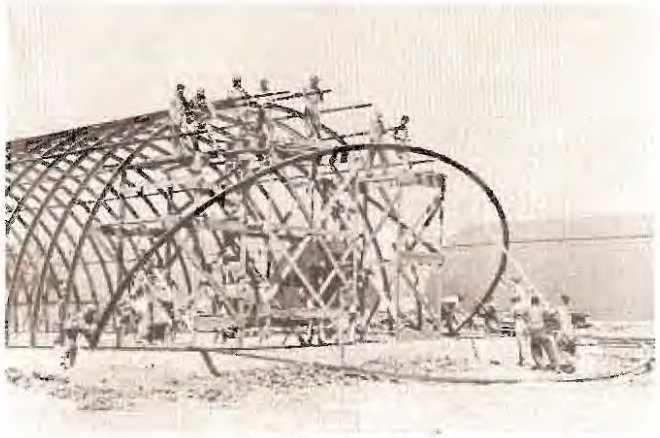
TYPICAL RIB AND PURLIN FRAMING DIAGRAM



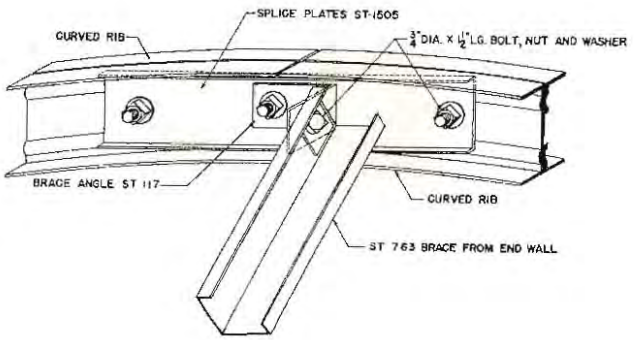
SPLICING PARTS AND RIB SECTIONS

END RIB

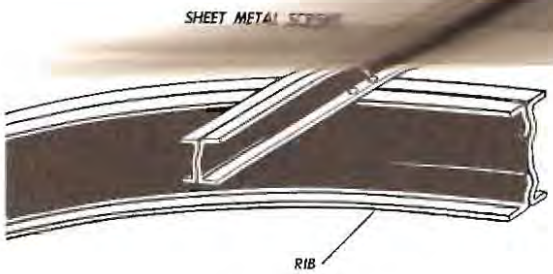
COMPLETED SPLICE



ERECTING RIBS



BRACE FROM END WALL



RIB AND PURLIN

FASTENING BRIDGING

STEP 2 The frame consists of a series of semi-circular ribs assembled from three sections and spaced at 4′0″ on center. The ribs are secured to the channels at the bottom. At the top of the building there are seven rows of steel purlins which run lengthwise of the building and are screwed to the ribs. Seven pieces of channel bridging are fastened to ribs in each 4′ spacing. Procedure:

(a) Assemble all the ribs on the ground. Each rib consists of three sections, each marked ST-1230. Assemble the ribs near their location in the building. To do this, place the sections on the ground near their location in the bottom channels. Join the three sections with two splice plates (ST-1505) at each joint, one on each side of the ribs, and four ¾″ dia. x 1½″ bolts with washers on one side only. (See photos.)

(b) To raise the ribs construct three light, movable platforms out of crating lumber. Two sections 13′0″ high and one section 15′6″ high will be satisfactory. (See page 14.) The ribs can then be easily raised in the manner shown in the accompanying photographs.

(c) Raise an end rib first, then follow with four others in sequence, securing each rib as it is raised to the channels with four screws. (See detail.)

(d) As successive ribs are raised, install the purlins (ST-590) and channel bridging (ST-1226) in their proper location. Attach the purlins to the ribs with at least two screws placed diagonally on each rib (see detail), but use four screws where two purlins join. The purlins should be erected as the ribs are raised, using the staging that is then in position for the rib raising operation.

Fasten bridging to ribs by driving in screws into top flanges and then bending ends of bridging around both rib flanges. (See photo.)

(e) After the first four ribs have been raised, plumb them and brace them temporarily with planks crossed diagonally and nailed to the inside of the ribs. With this bracing in place, raise the remaining ribs, attaching purlins and bridging as the successive ribs are erected.

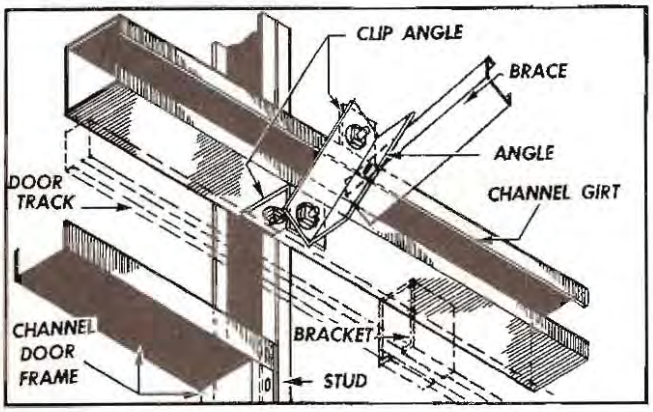
BULKHEAD FRAME PARTS READY FOR ASSEMBLY



CONNECTION OF BRACE TO WIND GIRT

BULKHEAD FRAME HOISTED INTO POSITION

DOOR JAMB AND GUIDE CHANNEL

STEP 3

Assemble the bulkhead frame on ground. Raise the complete frame, utilizing the scaffold previously built for erection of the ribs. Procedure:

(a) Attach bottom channels (ST-1586) to foundation with anchor bolts.

(b) Lay the vertical studs (ST-1487, 1488 and 1491) with their lower ends at their position in the channels and their upper ends resting on sawhorse.

(c) Connect the two pieces of wind girt (ST-440) with two splice plates (ST-743) using 16 bolts (½" dia. x 1").

(d) Fasten wind girt with four screws at each stud.

(e) Connect clip angles (ST-444 and ST-362) to wind girt as per drawings.

(f) Fasten doorhead channel (ST-54) to door jamb studs with screws. Then position studs (ST-107) and connect to wind girt and doorhead channel.

(g) Attach rafter clips (ST-2) to tops of all vertical studs. Slip the clip over the flange of the stud, and bend the projecting part of the clip to the approximate angle it will be when in place against the rib. Do not nail the clips to the studs until later, since they may have to be adjusted in height after frame is raised.

(h) Square entire bulkhead assembly before raising. Hold square by means of boards crossed diagonally nailed to studs on each side of door opening. Leave this bracing in place until framing is raised and secured.

(i) Raise bulkhead frame evenly and slowly to vertical position. Fasten studs in bottom channels (ST-1586) with four screws. Erect stud (ST-1486) to rib and channels.

(j) Adjust rafter clips until projecting parts of clips are snug against underside of the ribs. Then nail each clip to stud and the rib with 6d nails.

(k) Connect clip angles (ST-117) to splice bolts of third rib. Then bolt braces (ST-763) to clip angles at the rib splice and at wind girt. Tighten bolts. Remove temporary wooden bracing from bulkhead only.

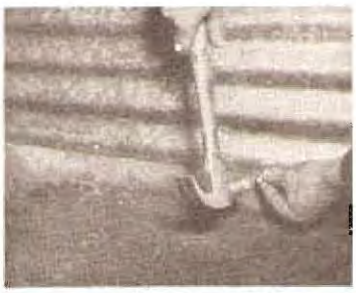
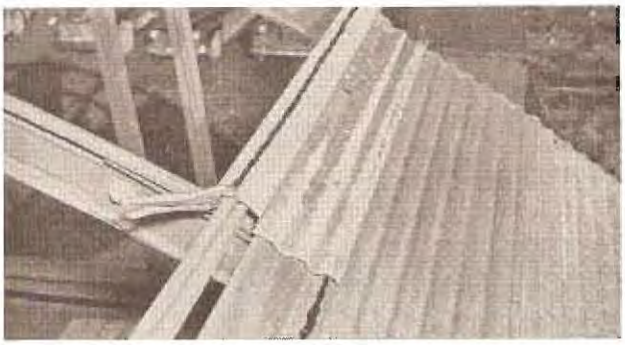
MARKING GUIDE LINE ON FOUNDATION FOR APPLYING SHEETS

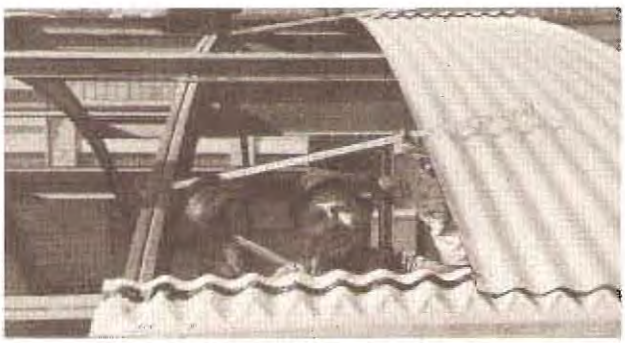
FIRST ROW OF SHEETS ON SIDE WALL



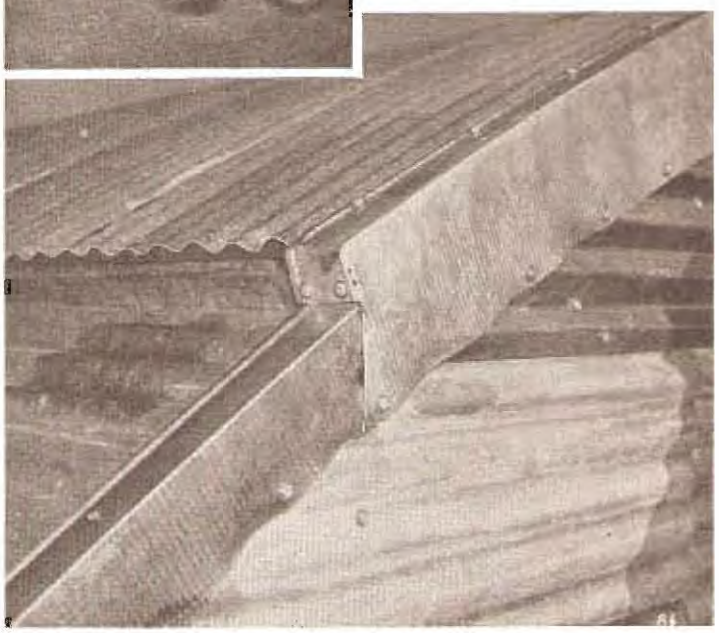
(LEFT) ATTACHING SHEET TO CONCRETE WALL



FLASHING STARTED AT ONE END



CURVED SHEETS STARTED



FLASHING DETAIL AT BULKHEAD

STEP 4 Each side of the building is covered with 11 rows of 26″ wide flat corrugated sheets. ST-32 and ST-34 sheets are used for these rows according to layout in sketch on opposite page. These sheets are fastened to ribs with lead seal nails 8″ o.c.

Seal all vertical and horizontal laps of sheets with a ¼″ dia. bead of mastic.

All laps of corrugated sheets between purlins and ribs are stitched with sheet metal screws and lead washers 12″ o.c. Procedure:

(a) Start at bottom with corrugated sheets 3″ below top of concrete. Side sheet vertical laps are 2″, side sheet horizontal laps are 4″.

(b) Fasten bottom sheets to clip angles (ST-1630) with 3/16″ stove bolts, using lead washers.

(c) When 11 rows are installed on each side, flashing (ST-1449) is nailed to lower purlin and screwed to top edge of sidewall corrugated sheets. (See photos.)

(d) Corrugated rubber strips are placed on top of flashing (ST-1449) and then three curved sheets (ST-1250) are secured to purlins with lead seal nails 8″ o.c. Side laps of these curved sheets are 3⅛″.

(e) Remove wooden temporary bracing.

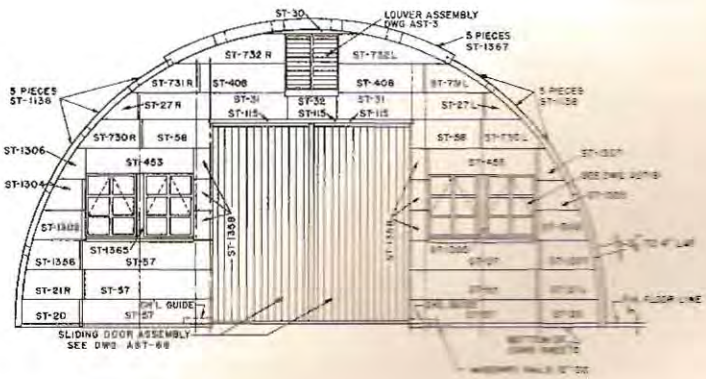
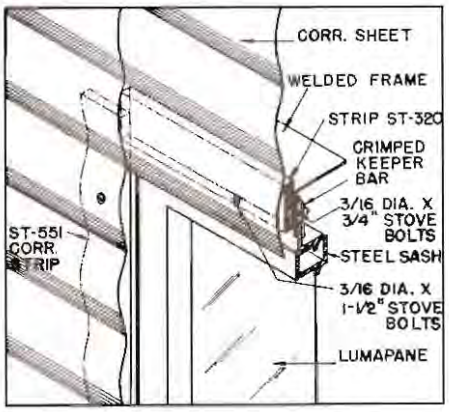
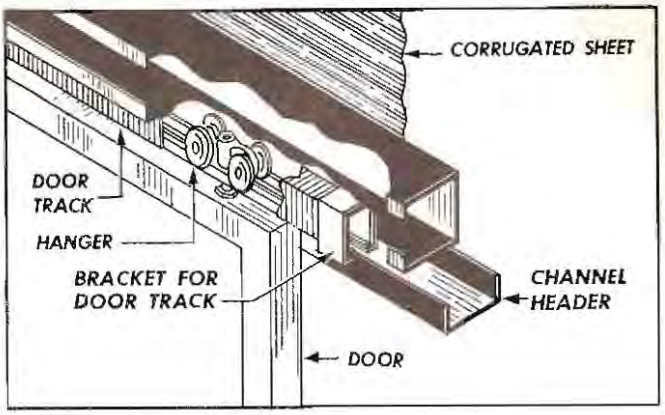
DOOR STOP AND GUIDE



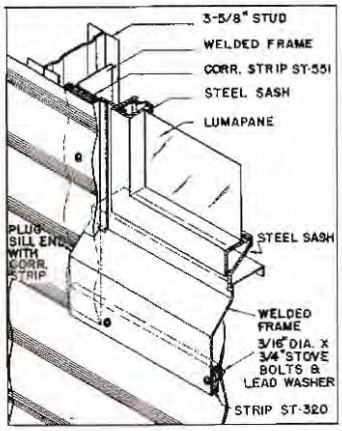
ELEVATION OF BULKHEAD WITH DOOR



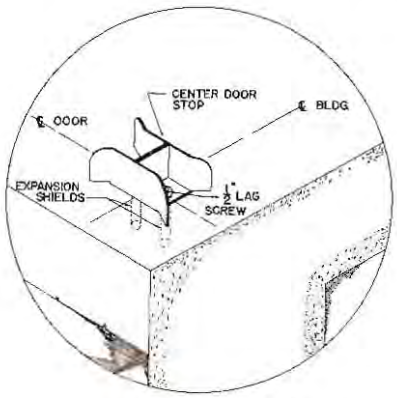
DETAIL AT WINDOW HEAD



DOOR TRACK AND HANGER



BOTTOM CORNER OF WINDOW



CENTER DOOR STOP

STEP 5 Apply bulkhead corrugated sheets. Install windows, doors and louvers. Procedure:

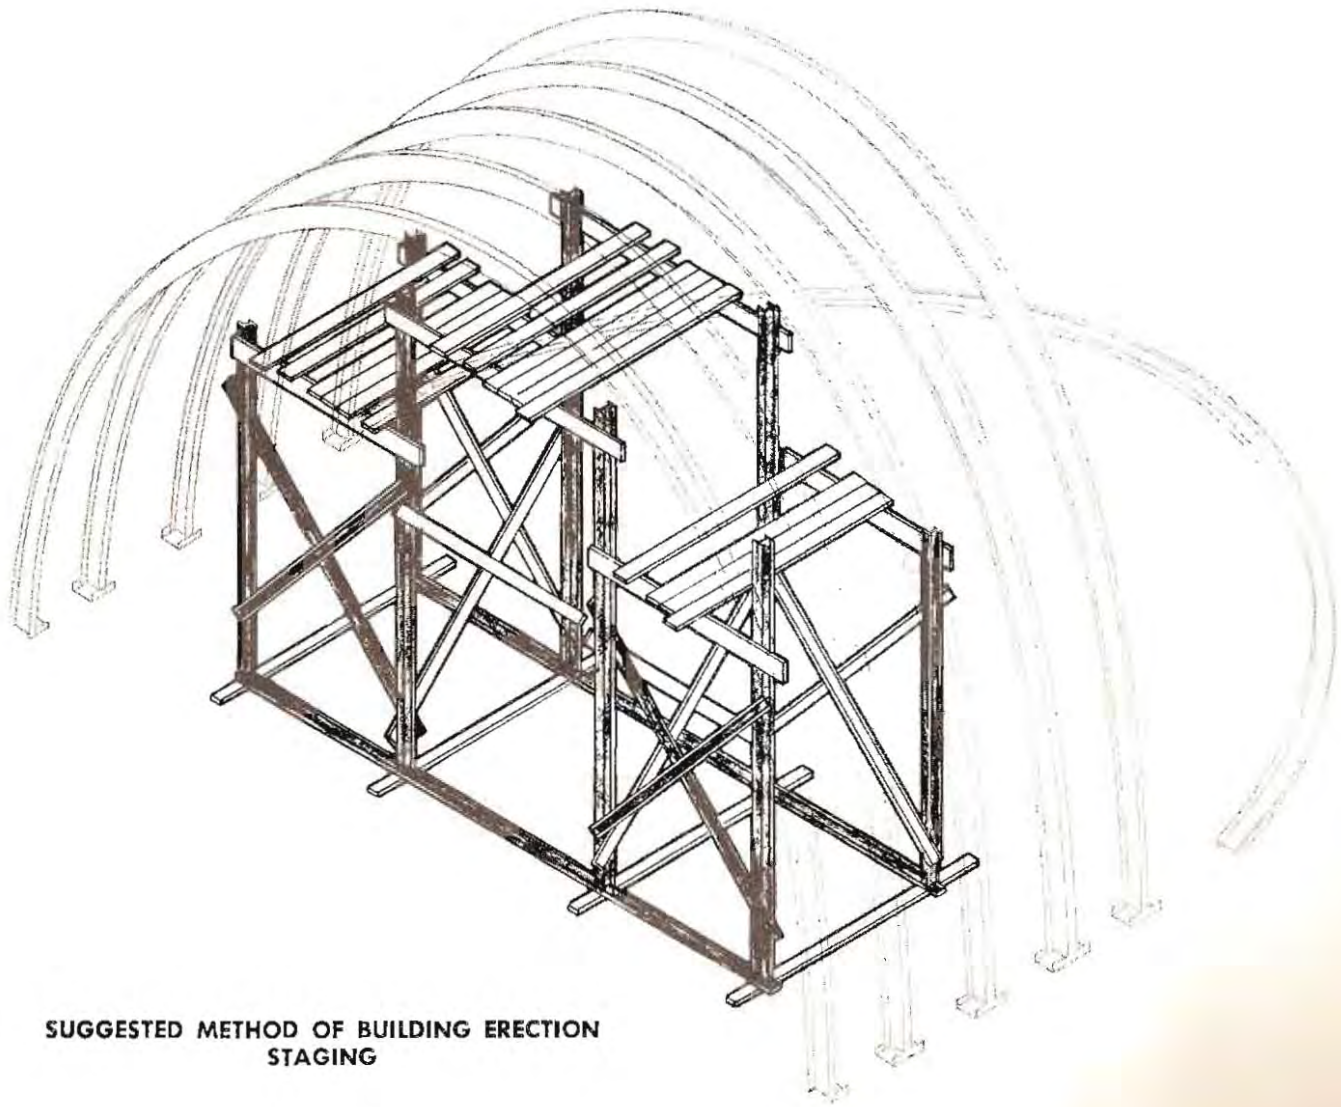
(a) Covering. The corrugated steel sheets on bulkhead are applied along with the installation of windows and louvers. Start with corrugated sheets 3″ below bottom of channels, and apply corrugated sheets, corrugated and flat asphalt or rubber strips, and flashing around openings according to layout on sketches above. Nail corrugated sheets to studs with lead seal nails 8″ o.c. Apply a ¼″ bead of mastic on all horizontal and vertical laps. Stitch all laps between studs with sheet metal screws and lead washers 12″o.c.

(b) Windows. After three rows of corrugated sheets have been applied, attach welded steel window frames to studs by means of two brackets (ST-413) at each jamb. Brackets are bolted to window frames and nailed to studs. Install window sash by means of keeper bars (ST-317), four to each jamb and two to each head. Secure keeper bars to sash with stove bolts. Corrugated and flat asphalt or rubber strips are applied to jambs, heads and sills, and flashing (ST-1365) applied to mullions. Corrugated sheets and flashing are fastened to window frames by stove bolts with lead washers.

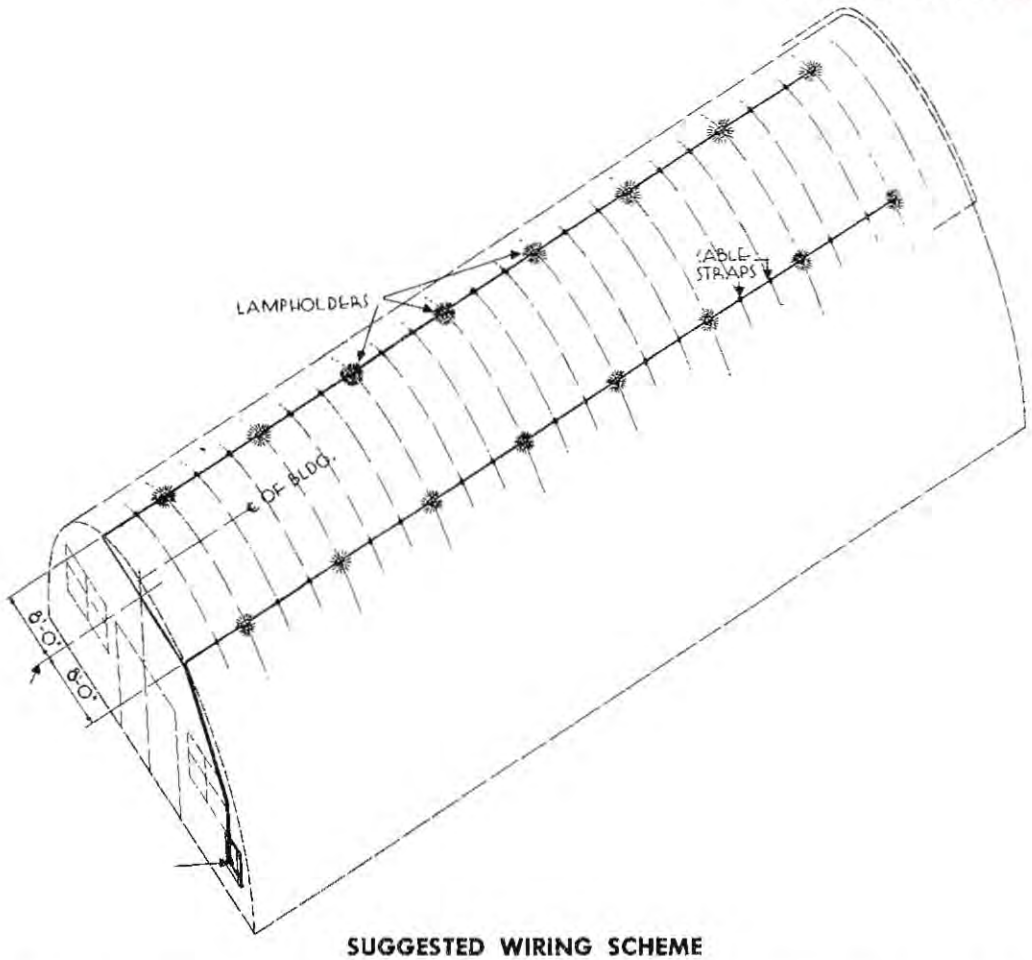
(c) Louvers. Attach flashing to sill of louver with screws and place complete assembly between studs (ST-107) and over top edge of sheet over door. Fasten louver to studs with screws. Apply corrugated asphalt or rubber strips to jambs and fasten corrugated sheets around opening. Nail wood pieces to studs around louver inside building as shown on drawing AST-135. Staple on 2 x 2 hardware cloth.

(d) Curved Flashing. After entire bulkhead has been sheeted and all roof sheets placed, the curved flashings (ST-1138 and ST-1367) are applied around arc. (See sketch, photos and drawing AST-76.)

(e) Doors. Bolt the brackets that support the door track to the bottom flange of wind girt. Slide track into place and hang two leaves of door by means of two trolleys for each door leaf. Locate center floor stop (see sketch) and secure to concrete with ½″ lag screws and expansion shields. Locate channel guides (ST-1241) at door jamb and door stop for open position. Fasten guides and stop to concrete with ½″ lag screws and expansion shields.



SUGGESTED METHOD OF BUILDING ERECTION
STAGING



SUGGESTED WIRING SCHEME

STEP 6

The electrical system consists of two lighting circuits extending lengthwise of the building, one on each side of the centerline, terminating in a switch box at the service end of the building. Non-metallic sheathed cable and lamp sockets, which are secured to the bottoms of the ribs, comprise each circuit.

Each building is furnished with equipment for 18 sockets. A basic wiring scheme, suggested in the above sketch, requires 16 of these. This scheme provides for two additional sockets to be placed at optional special locations, or for spare equipment. Installation procedure:

1. Build a mounting board for the fuse box and switches at the service end of the building out of lumber from opened crates. Make the board sufficiently large to accommodate future switches and power switches as they are required. Nail mounting board across two bulkhead studs.

2. Remove the cover from the switch box and screw the box to the mounting board.

3. At eight feet on each side of the centerline of the building stretch a chalk line across the bottoms of the ribs for the length of the building parallel to its longitudinal axis. These will serve as guide lines for mounting the junction boxes to the ribs of the building.

4. Nail junction boxes to every third rib where each guide line crosses the ribs. (See sketch.) Punch out junction box holes through which cables will pass. Feed sheathed cables through boxes, securing cables with straps nailed to the ribs.

Slip wires attached to sockets through porcelain rosettes. Splice socket leads to cable wires, and cover bare wires with rubber tape and friction tape. Screw rosettes to junction boxes.

(Drop cords or extension cords may be assembled from flexible rubber-covered wires and attachment plug hardware furnished.)

5. At the bulkhead take the remaining cable of the circuit on the side of the building opposite the switch-box across the bulkhead over the louver until it meets the remaining cable of the circuit. Take the pair of cables diagonally across the inside face of the bulkhead to the top of the windows over the switchbox then vertically into the switch box, securing the cables to the studs with cable clamps.

6. Connect the cables into the switch box.

Crates Reqd. to Make 1—40′ x 100′
Quonset Q40 Building

20 Crates

Total Cu. Ft. 407.62
Gross Weight 22154
Net Weight 20609

NOTE: Cube of packages shown with an asterisk (*) are computed on a net basis. These packages contain the curved ribs and curved sheets. For the purpose of storing and shipping, these packages can be nested and the number of packages to be nested will determine the cubic space required for storing and shipping. Computed on the basis of nesting the curved ribs and curved sheets for ten (10) buildings, the total cube of one (1) building would be increased by 23.88 cubic feet.

INSTALLATION INSTRUCTIONS

1. BOLT THE CHANNEL CLIPS ST-413 TO THE ANGLE JAMBS OF THE STEEL WINDOW FRAME USING TWO CLIPS AT EACH JAMB. SEE ELEVATIONS FOR POSITION OF CLIPS.
2. PLACE WINDOW FRAME IN POSITION BETWEEN THE STUDS WITH TOP OF WINDOW SILL AT DIMENSION SHOWN ON ERECTION DRAW'G AND NAIL THE CLIPS INTO NAILING GROOVE OF THE STUDS.
3. APPLY MASTIC TO INSIDE OF WINDOW FRAME AND A PORTION OF SASH FOR A CONTINUOUS LAP WIDTH OF ONE HALF INCH SO AS TO SEAL THE JOINT BETWEEN SASH AND FRAME.
4. INSTALL STEEL SASH FROM INSIDE OF BUILDING BY BOLTING THE TWO KEEPER BARS ST-317 TO THE WINDOW FRAME TO SECURE THE SASH IN THE PROPER POSITION. (TWO KEEPER BARS ST-317 AT HEAD.)
5. INSERT THE FLAT STRIPS ST-320 OVER CORRUGATED METAL SHEETS UNDER SILL, CAULK WITH MASTIC AT EACH END OF SILL. INSERT SEVEN BOLTS THRU WINDOW SILL AND CORRUGATED SHEETS.
6. AT JAMBS (EXCEPT MULLIONS) DRILL $\frac{1}{4}$" DIA. HOLES THRU CORR. SHEET, CORRUGATED STRIP AND FRAME FOR $\frac{3}{16}$" DIA. X $1\frac{1}{2}$" STOVE BOLT & LEAD WASHER 8" O.C. (IN VALLEY OF CORR. SHEETS). ATTACH 4 KEEPER BARS ST-317 TO 4 OF THESE BOLTS OF EACH JAMB.
7. IF WINDOWS OCCUR IN ADJOINING 4'-0" SPACES BETWEEN STUDS THEN A METAL FLASHING SHEET ST-1365 IS TO BE BOLTED TO THE ANGLE MEMBERS OF WINDOW FRAME AS WELL AS AT SILL MEMBER. SEE MULLION DETAIL.
8. APPLY CORRUGATED METAL SHEETS OVER FLAT STRIP ST-320 AT HEAD OF WINDOW & BOLT TO HEAD MEMBERS OF WINDOW FRAME. APPLY MASTIC TO FACE OF FLAT STRIP TOUCHING FRAMES BEFORE INSTALLING.

NOTES:

PAINT ALL OUTER SURFACES OF FRAME AND SASH WITH OLIVE DRAB CAMOUFLAGE PAINT.
WINDOWS TO BE GLAZED WITH LUMAPANE OR EQUAL CLEAR TRANSPARENT PLASTIC WITH SCREEN MESH, SET IN THE SASH WITH SEALER.
